CPUE report

CPUE analyst · Run 001 · Years 2000–2021

Calculation finished (container exit 0).

Analysis	Rows	Excluded	Converged	Dispersion	Score residual	Final index
A	132	0	Yes	1213	4.241e-13	0.5626
B	132	0	Yes	3011	1.332e-15	0.6146

Quasipoisson GLM: year + cell–quarter stratum; Quasipoisson GLM: year + quarter. Nominal = 1,000 × annual fish / annual hooks; both curves use the same selected records. Arithmetic mean of response-scale predictions with equal fixed stratum weights. The relative index passed to assessment equals one in its first year.

Final index is the last standardised value relative to its first year. Dispersion is Pearson residual sum of squares / residual df; score residual checks the fitted aggregate totals.

Scope: Fiji fleet; six observed cell–quarter strata, 2000–2021; aggregate records without vessel effects or confidence intervals.
