# CPUE analysis

Nominal = 1,000 × annual fish / annual hooks, using the same selected records as each standardised curve. Quasipoisson GLM: year + cell–quarter stratum; Quasipoisson GLM: year + quarter. Arithmetic mean of response-scale predictions with equal fixed stratum weights.

## Relative indices

| Analysis | Rows | Excluded | Min hooks | Converged | Dispersion |
|---|---|---|---|---|---|
| A | 132 | 0 | 0 | Yes | 1213 |
| B | 132 | 0 | 0 | Yes | 3011 |

Each index is scaled to its own first year (= 1). Dispersion is the Pearson residual sum of squares / residual df.

**Scope:** Fiji fleet; six observed cell–quarter strata, 2000–2022. Fleet–cell–quarter aggregates; vessel effects and confidence intervals are unavailable. Released zeros are retained; absent/suppressed values are excluded.
