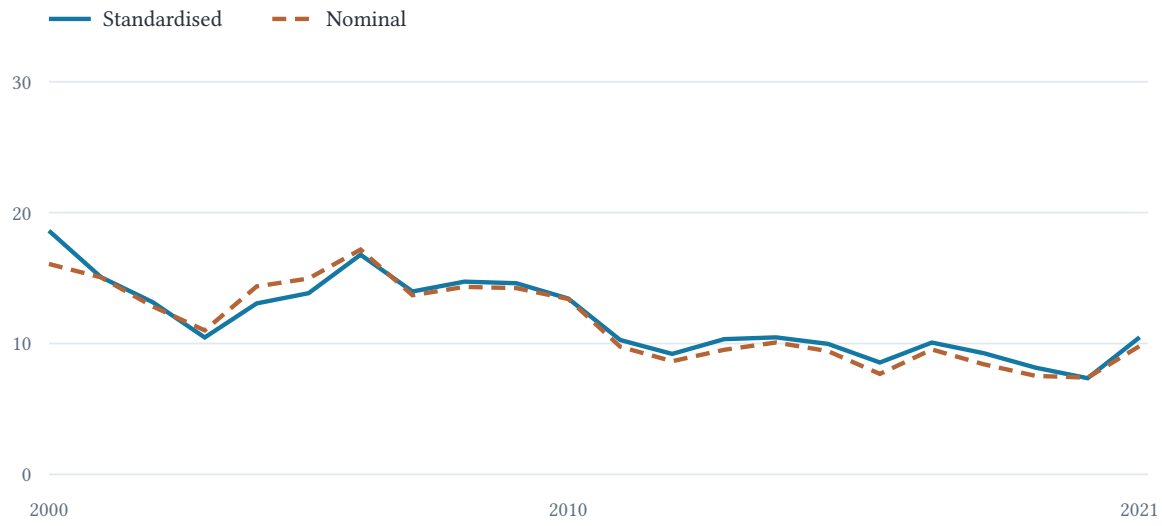
Compare CPUE results

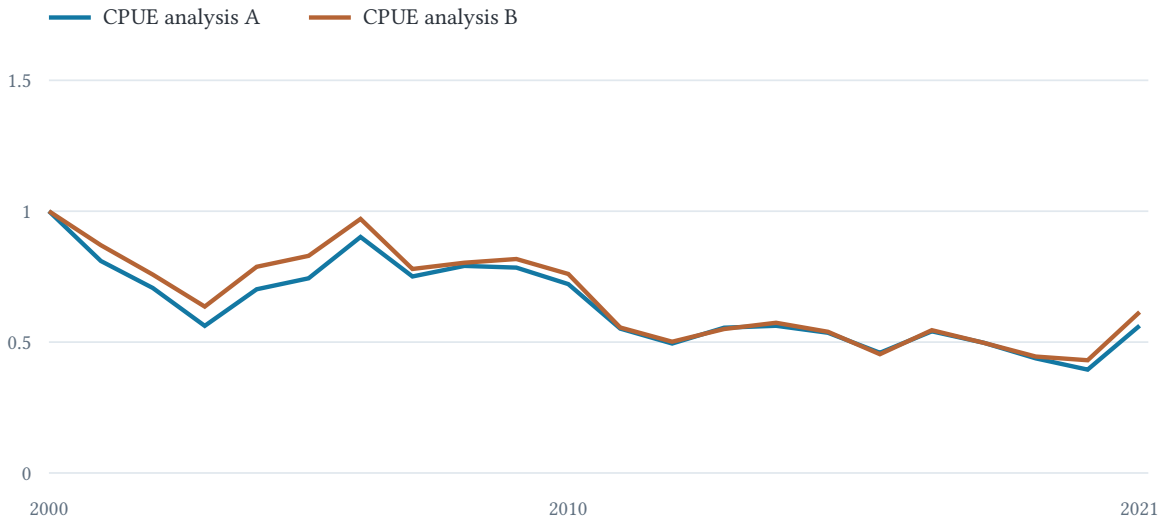
Fiji longline albacore · 2000–2021 · 132 released records used by A.

Standardised and nominal CPUE



Fish per 1,000 hooks

Relative indices A and B



Each index relative to its own first year

Both curves use the same selected rows; 132 used, 0 excluded; no additional effort filter.

The first plot uses the same A records for both curves. Any A effort filter applies to both; B uses its own eligible records.

Standardised: Arithmetic mean of response-scale predictions with equal fixed stratum weights. Nominal: 1,000 × annual fish numbers / annual hooks on the A rows.

A predicts catch at 1,000 hooks in each of six fixed cell–quarter strata and averages with equal weights. B adjusts quarter only on that support. The local fleet index has no supplied confidence intervals and has not been validated for stock-wide abundance.

The A/B comparison includes differences in adjustment and row selection. Each relative index equals one in its own first year.
