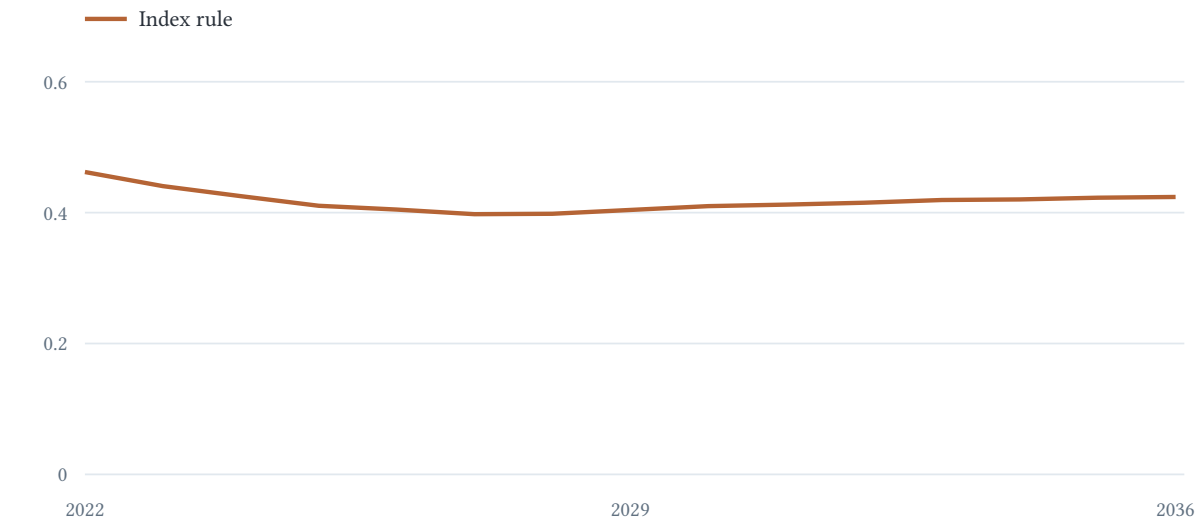
Index rule

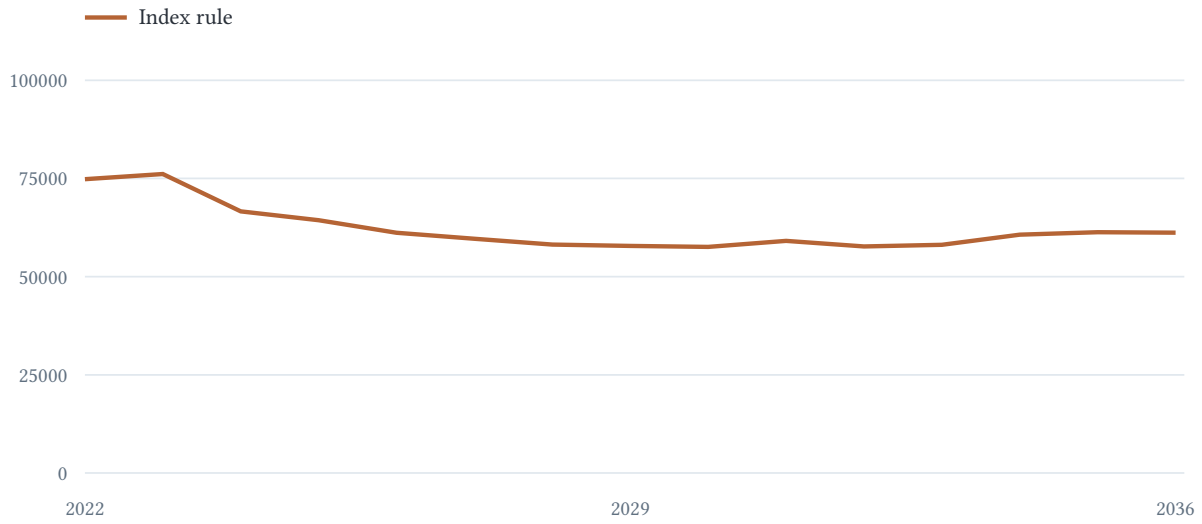
Scale catch by the three-year mean observed index.

Biomass across trials



Median end-of-year B / K

Realised catch across trials



Median annual catch (tonnes)

These medians combine the declared stock cases and growth scenarios with equal weight; they are conditional examples.

Management rule	Mean catch (t/year)	Final B / K	Trials below 0.2 (%)	Catch change (%)
Index rule	6.266e+04	0.4239	0	6.707

Final biomass is the median across trials. The threshold column counts trials that fell below 0.2 of carrying capacity at any time; 0.2 is an illustrative comparison level. Catch change is annual absolute change relative to mean catch, including the first change from recent catch. Cases and scenarios have equal weight, not estimated probabilities.

Each year: observe the index, set catch, then update the stock.

The selected Fiji fleet index is not a validated stock-wide abundance index. Using it with stock-wide catches is a teaching assumption.

The shared guardrail caps realised catch at 40% of true starting biomass. Biomass and low-biomass statistics are conditional on that safeguard.
